Continuous Integration

Continuous Integration is a **developer practice** with the goal to always keep a **working system** by making **small changes**, slowly growing the system

and **integrating** them at least **daily** on the **mainline**

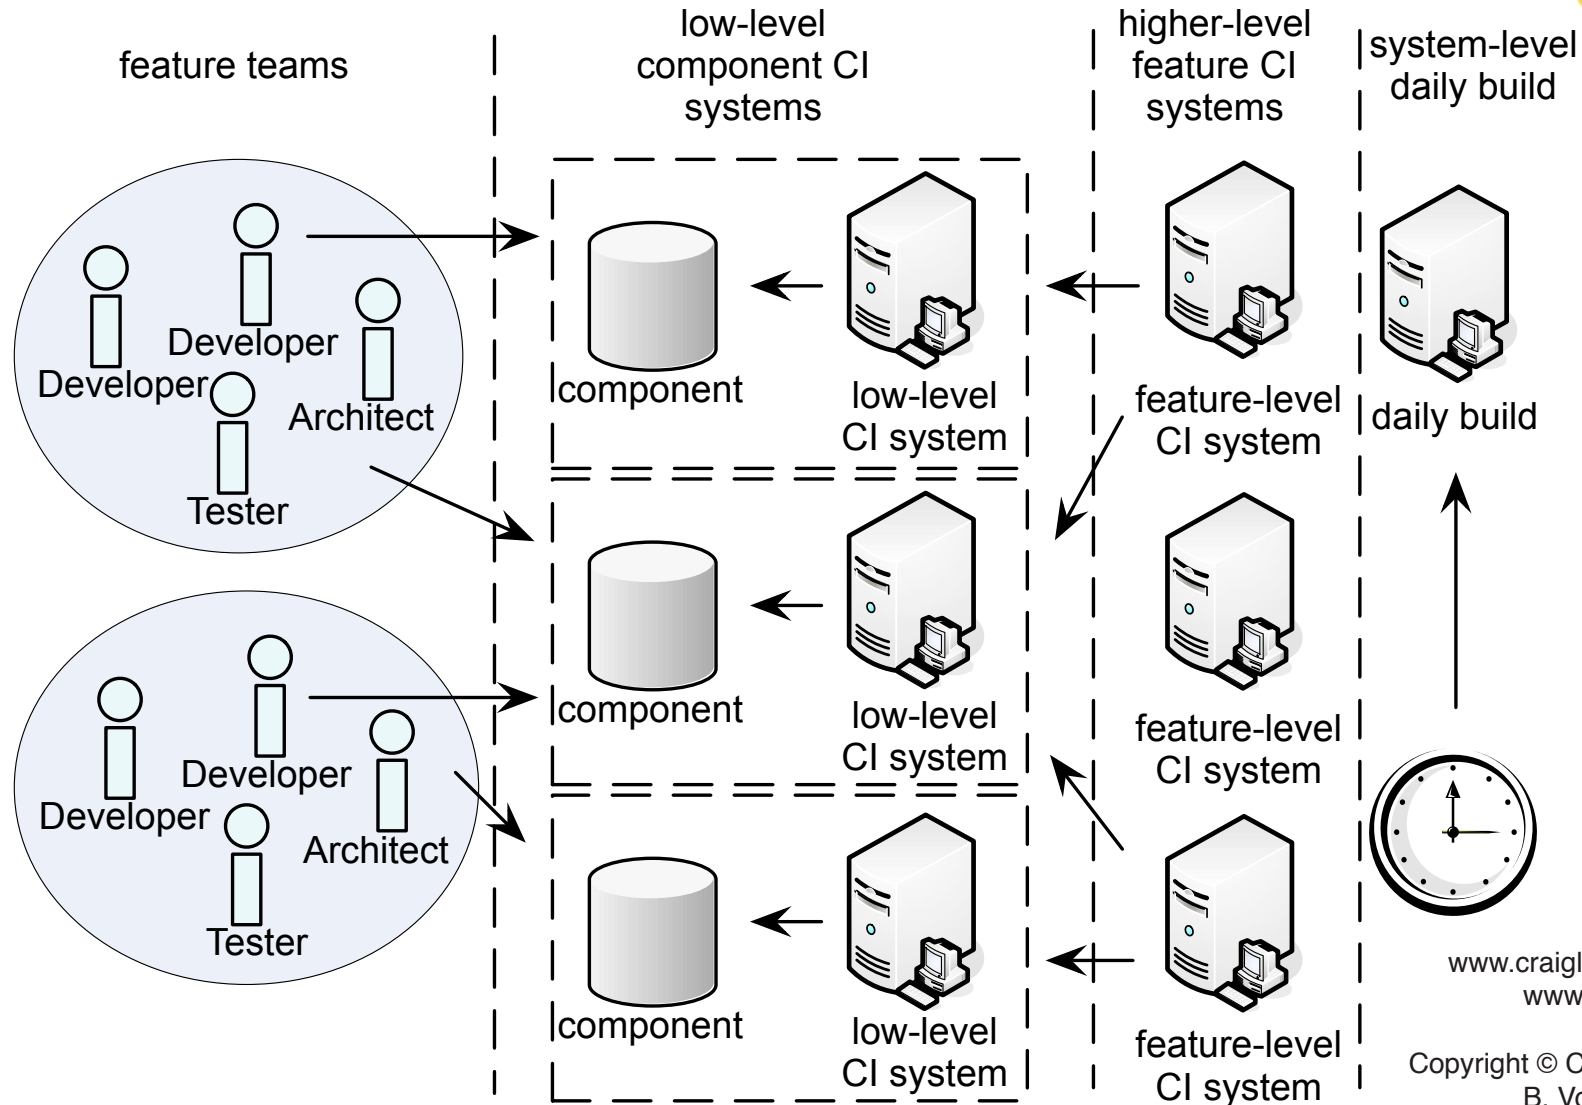

typically supported by a **CI system** with lots of **automated tests**

Large-scale setup

Product Owner

Product Backlog

Feature teams

Conway's law

Any organization that designs a system (defined more broadly here than just information systems) will inevitably produce a design whose structure is a copy of the organization's communication structure.

And...

Because the design that occurs first is almost never the best possible, the prevailing system concept may need to change. Therefore, flexibility of organization is important to effective design.

- Mel Conway

One ProductOwner

Multiple Teams

Teams own a part of
the system:

“Component teams”

Low value work is implemented

Everybody always busy?

Re write
Re Design
Re Architecture

“Work gets created”

Large systems... grow
larger by default

One requirement
does not map to one
team

Dependencies never
balance out

Result: Not complete
requirements
integrated

Assign a problem to a role

Impossible job, requirements never balance out.

Result: priority and resource fights

Large backlog items must be split in “less customer-centric backlog items”

Splitting before the iteration starts:
“Architecture”

Testing after the iterations ends:
“System test”

How to become good? ...

One ProductOwner

3 Teams

Give complete requirements to teams:
“Feature teams”

All dependencies within the team

Feature Teams

- long-lived—the team stays together so they can ‘jell’ for higher performance; they take on new features over time
- cross-functional and co-located
- work on a complete customer-centric feature, across all components and disciplines
- composed of generalizing specialists

New problem:

Dependency moved

Modern version control (e.g. svn)

Continuous integration development practice

Automated build and test

ABC

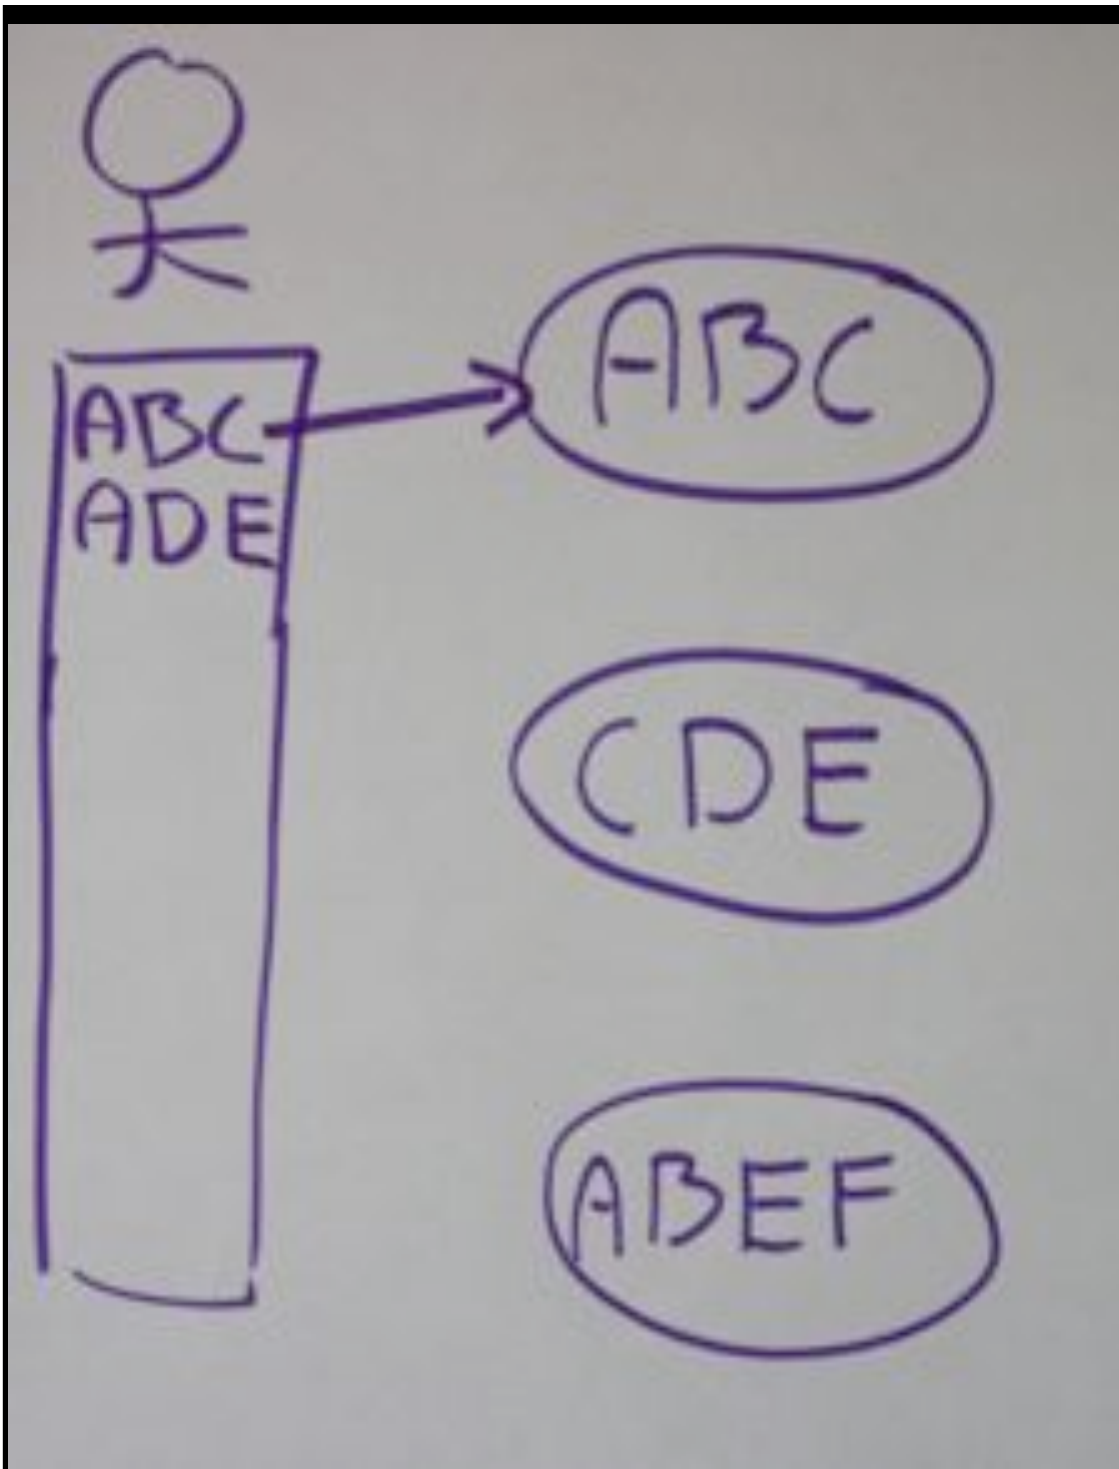

CDE

ABEF

Person specialization

Team specialization

Team specialization

Specialization good

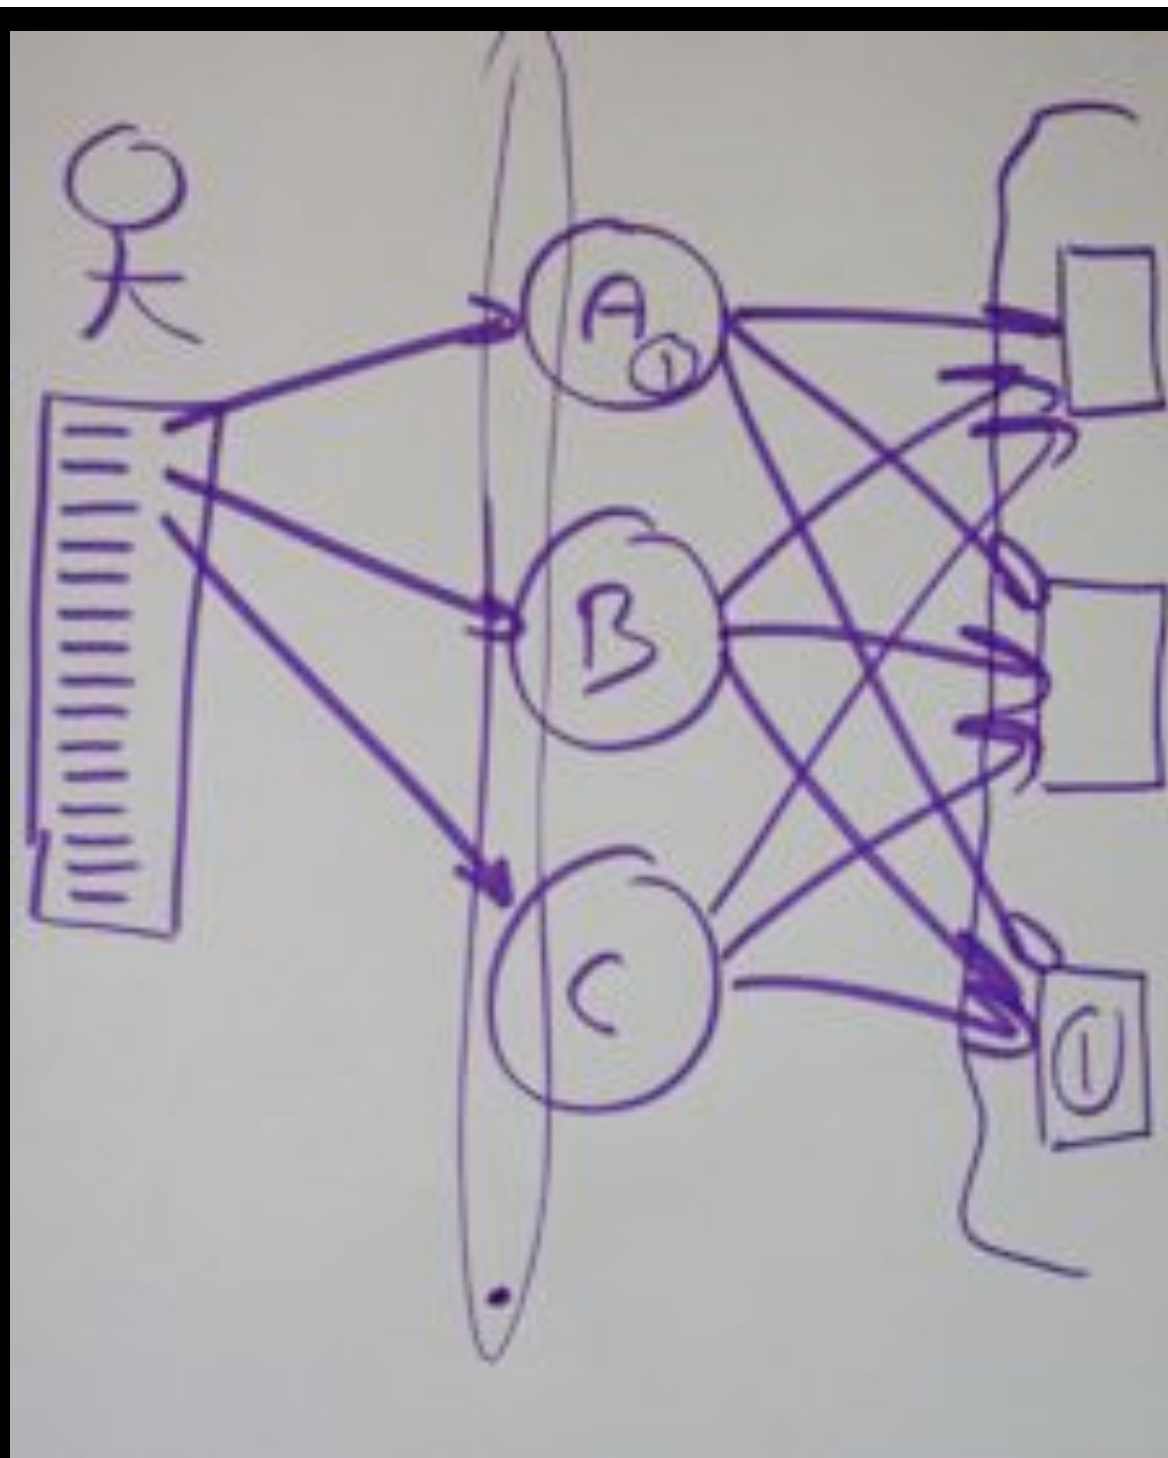

Don't let
specialization
constrain you

Learn new
specializations

Emergent design

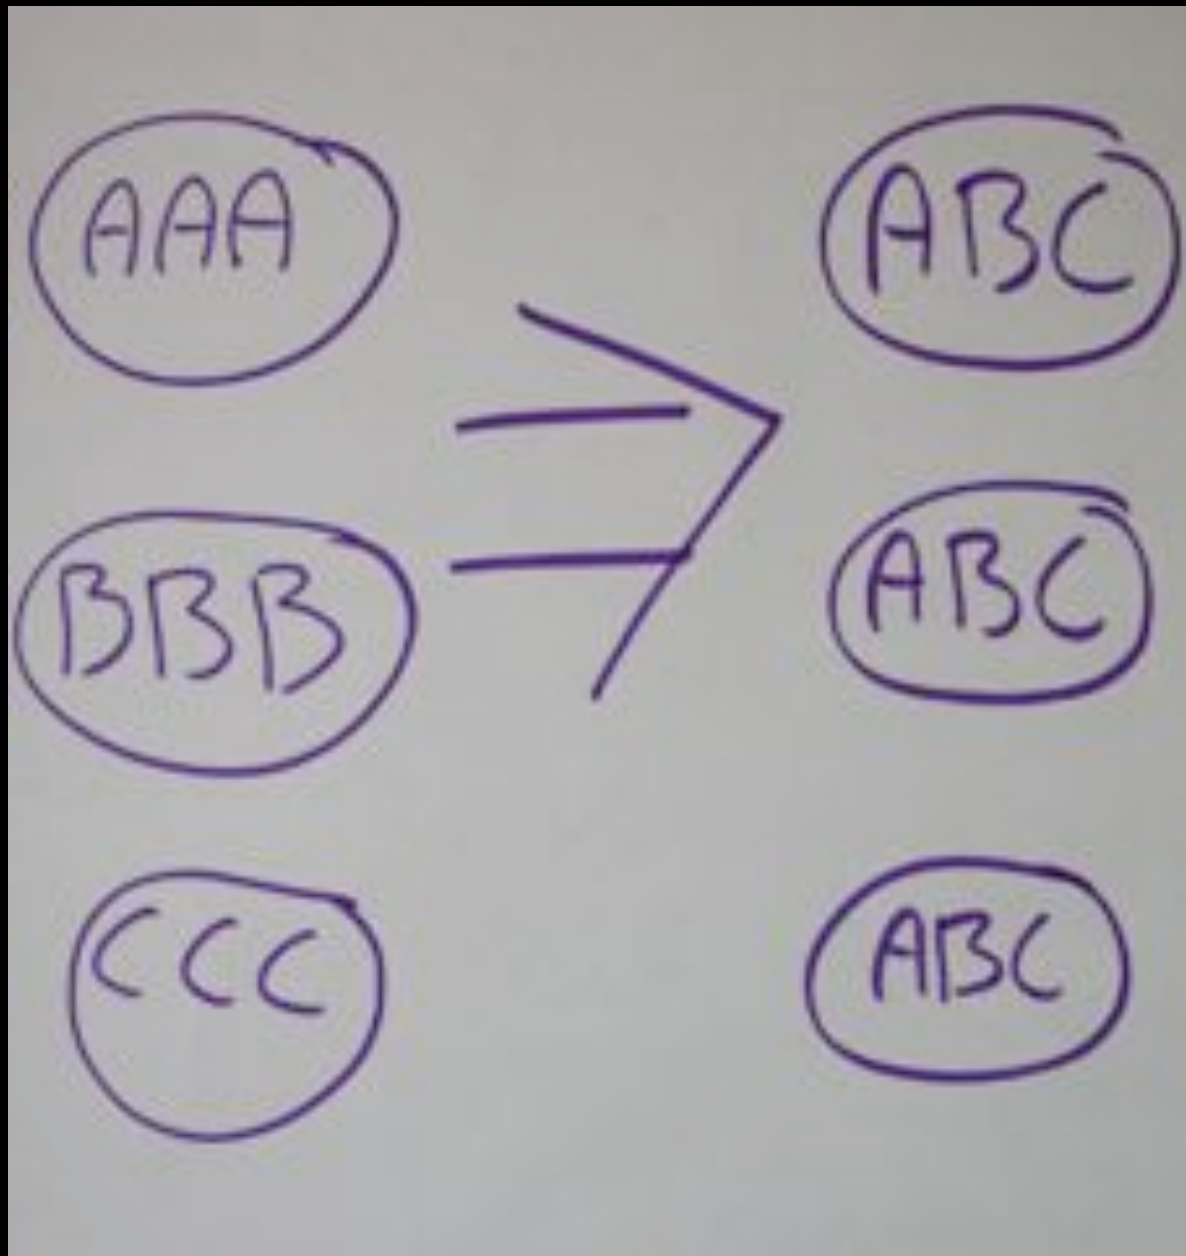

Component guardians

Community of Practice

Architect Facilitator

Same for e.g. test, ScrumMasters

Transition can often
be done by reforming
teams

What about large
product development?

Always have one
product owner and
one product backlog
per product

Or... a group of
products...

Group requirements into “categories” called: “Requirement areas”

Grouping based on customer, **NOT** on architecture

Create “requirement area backlogs”

RA backlog is a view on the product backlog

Every PBI maps always to exactly one RA backlog

Every RA has their own “area product owner”

RA product owner specializes in “customer-centric domain”

Every RA has a set of feature teams

From 5-10 per RA

Teams specialize in that area

Areas are dynamic over time

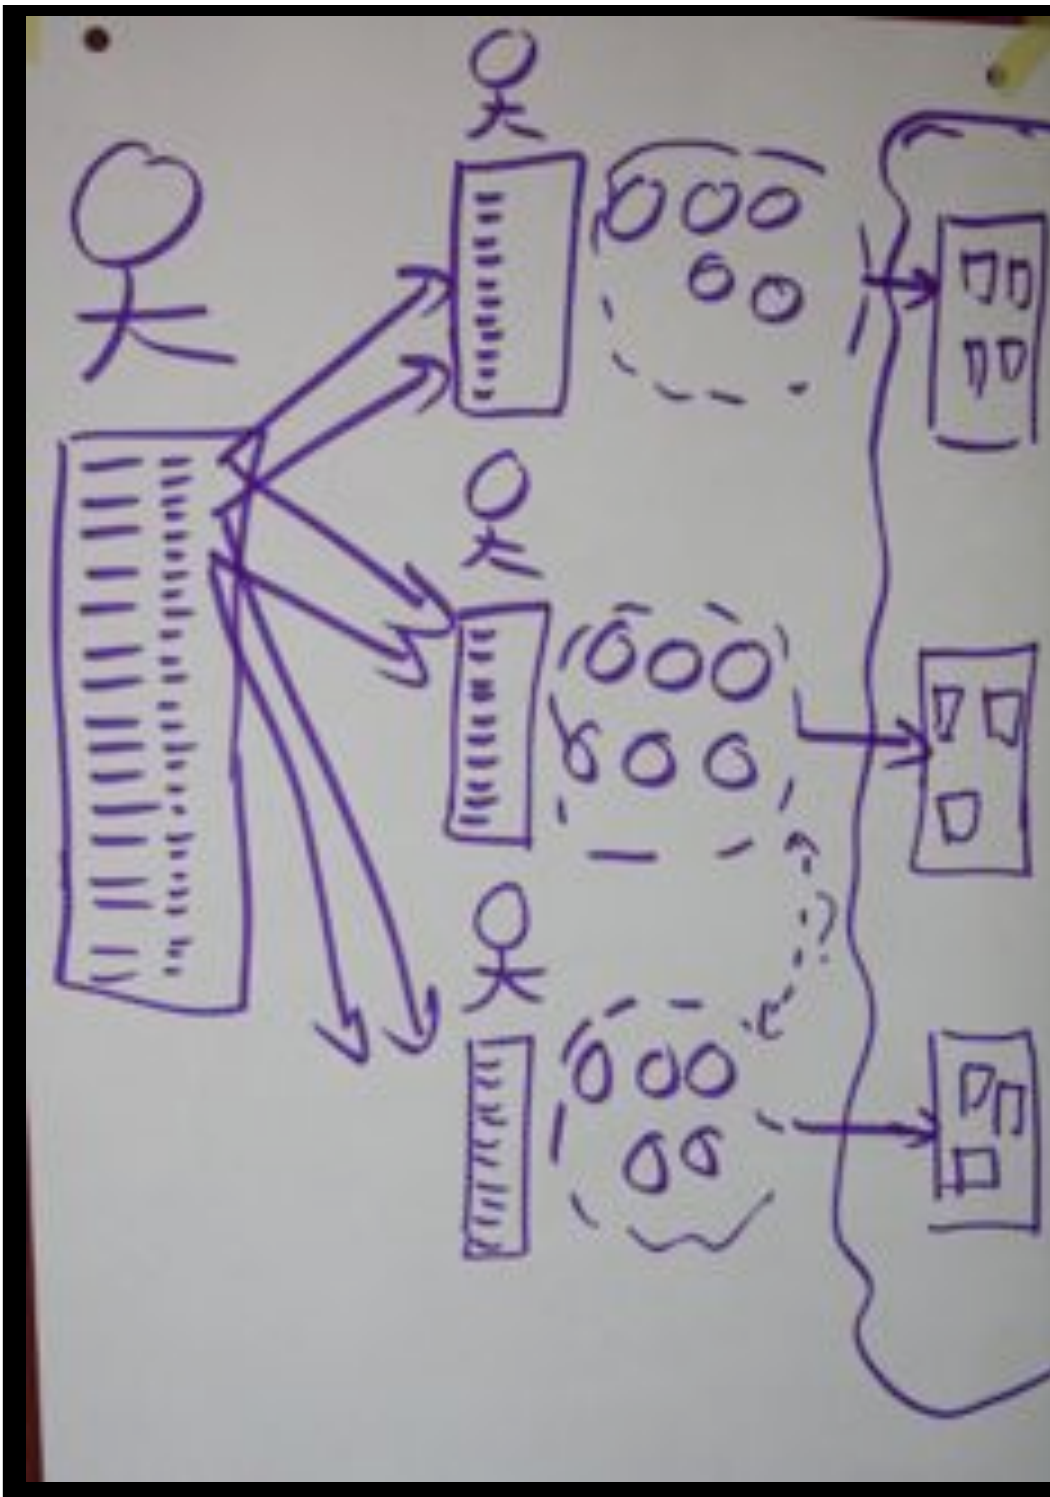

Overall PO decides
on moving teams
between areas

Value vs velocity

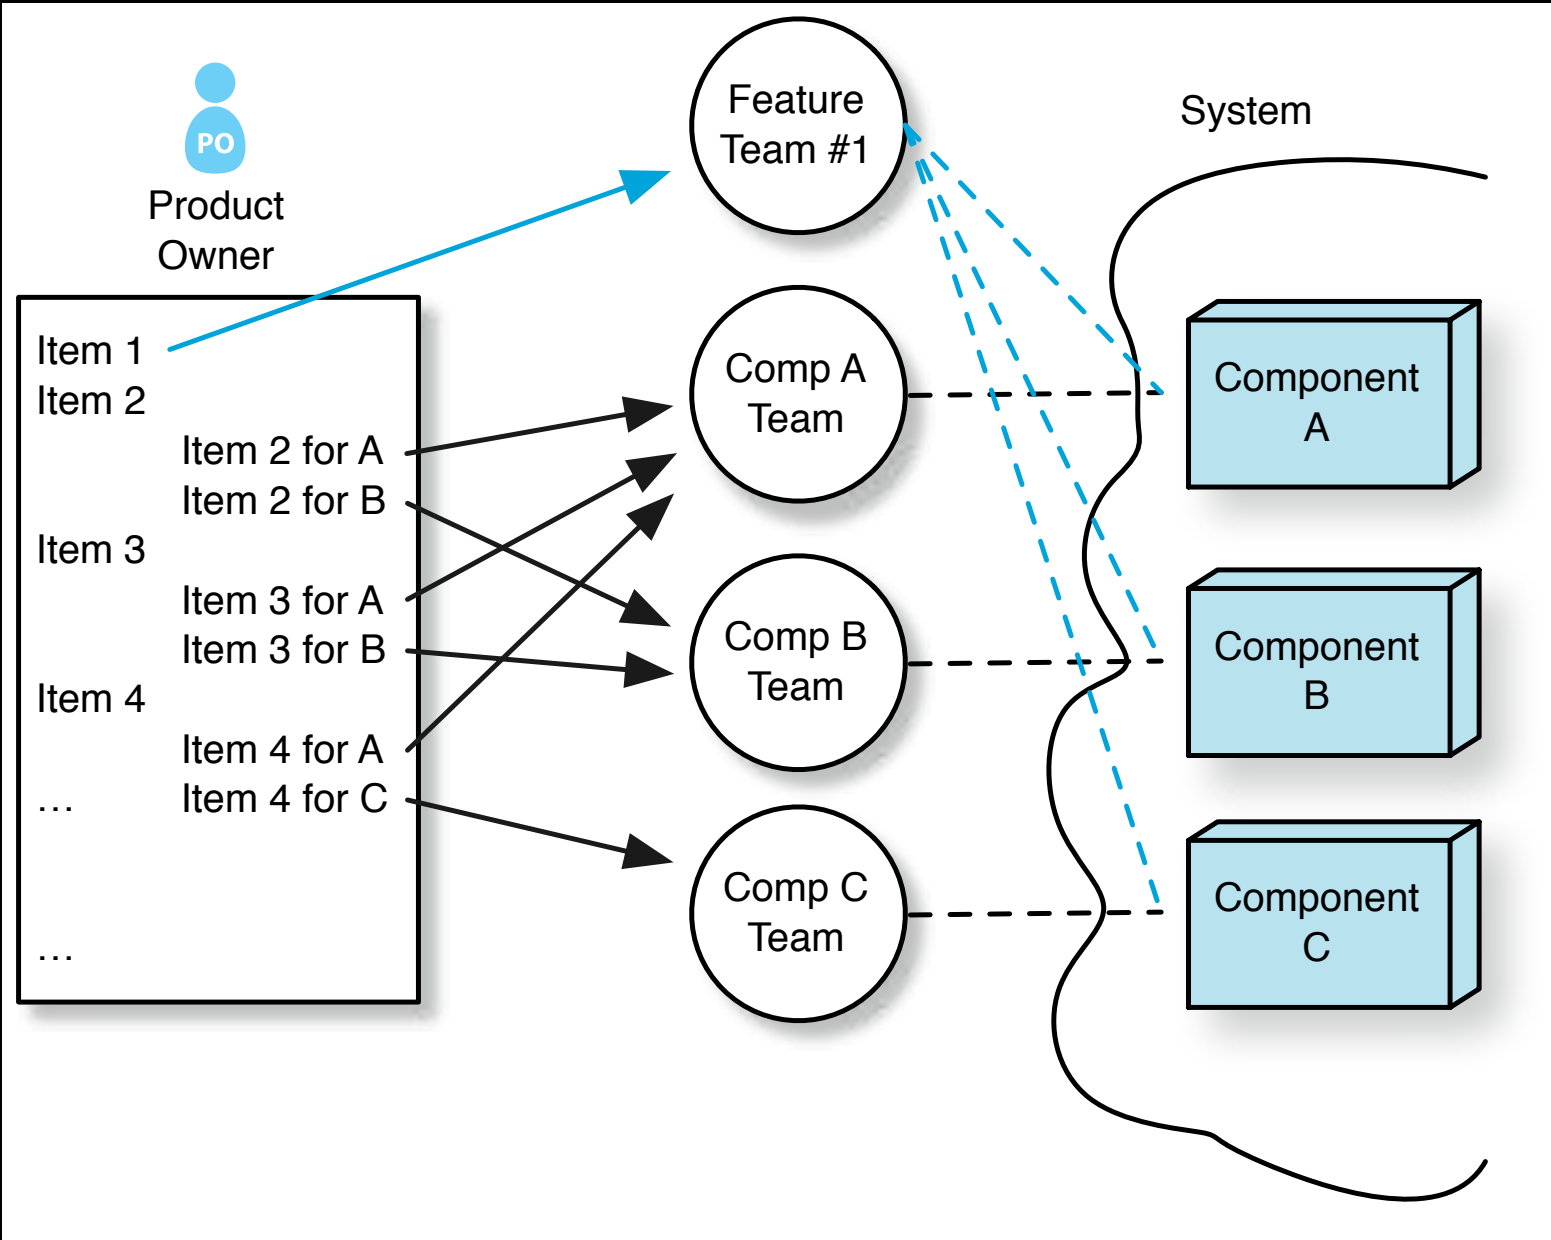

Transition strategy

“Development areas”
are groupings based
on architecture

Helps transition, has
all drawbacks of
component teams

Questions?
